## SUPPORTING INFORMATION

# Characterization of Biomolecular Helices and Their Complementarity Using Geometric Analysis 

Kevin Hauser ${ }^{1}$, Yiqing $\mathrm{He}^{2}$, Miguel Garcia-Diaz ${ }^{3}$, Carlos Simmerling ${ }^{1,4, *}$ and Evangelos Coutsias ${ }^{4,5, *}$<br>${ }^{1}$ Department of Chemistry, Stony Brook University, Stony Brook, New York, 11794<br>${ }^{2}$ Great Neck South High School, Great Neck, New York, 11023<br>${ }^{3}$ Department of Pharmacological Sciences, Stony Brook University, Stony Brook, New York, 11794<br>${ }^{4}$ Laufer Center for Physical and Quantitative Biology, Stony Brook University, Stony Brook, New York, 11794<br>${ }^{5}$ Department of Applied Mathematics and Statistics, Stony Brook University, Stony Brook, New York, 11794<br>*Corresponding address: E.: carlos.simmerling@stonybrook.edu, E.: evangelos.coutsias@stonybrook.edu

Table S1. Cartesian coordinates of Nievergelt's helix.

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ |
| :--- | :--- | :--- |
| 12 | 102 | 198 |
| 48 | 138 | 180 |
| 65 | 163 | 169 |
| 77 | 187 | 157 |
| 85 | 209 | 149 |
| 94 | 266 | 128 |
| 93 | 288 | 120 |
| 89 | 316 | 112 |
| 82 | 347 | 107 |
| 62 | 397 | 103 |

Table S2. Residues whose Ca atoms were used to define the BurrH superhelix.

| Module | Residue |
| :--- | :--- |
| 1 | Q42 |
| 2 | P75 |
| 3 | S108 |
| 4 | S141 |
| 5 | P174 |
| 6 | P207 |
| 7 | P240 |
| 8 | P273 |
| 9 | P306 |
| 10 | P339 |
| 11 | P372 |
| 12 | P405 |
| 13 | P438 |
| 14 | L471 |
| 15 | L504 |
| 16 | L537 |
| 17 | R570 |
| 18 | A603 |
| 19 | A636 |
| 20 | P669 |
| 21 | P702 |
| 22 | P734 |
| 23 | P765 |

## 

Figure S1. Helix parameters of Nievergelt's helix. (a) Helix pitch and radius (right and left $Y$ axis respectively), with increasing number of points ( X axis). (b) Percent relative error (Y axis), using Nievergelt's data as the reference, with increasing number of points (X axis).

Figure S2. Sine of the average difference in the helical axes of the test helices and the ideal helices. Helix matrices are organized per Figure 3. We plot the sine of the difference in the average spherical coordinate $\varphi$-angle of the optimal helical axes for the 256 noisy helices in each cell and the spherical coordinate $\varphi$-angle of the optimal helical axis from the corresponding ideal helix If the difference is $0^{\circ}$, then sine $\Delta \varphi$ is 0 ; if the difference is $45^{\circ}$, then $\operatorname{sine} \Delta \varphi$ is 0.5 ; if the difference is $90^{\circ}$, then sine $\Delta \varphi$ is 1 .

Figure S3. Percent AAE of derived helix twist for the 399,360 test helices. Helix matrices are organized per Figure 3. The plotted range of the percent average absolute error is 0 to 100.

Figure S4. Percent AAE of derived helix rise for the 399,360 test helices. Helix matrices are organized per Figure 3. The plotted range of the percent average absolute error is 0 to 1000.

Figure S5. Fitting residual of three slightly different $\alpha$-helical peptide secondary structure elements. Fitting residual was calculated using equation (12) and is plotted on the Y axis. The number of Ca atoms (one per amino acid) used in the fitting is plotted on the $X$ axis. Residual increases with the number of Ca atoms used in the fitting because each atom contributes to the total deviation; thus, residual rises nearly linearly with number of atoms.

Figure S6. Fitting residual of $\pi$ - and $3_{10}$-helical peptide secondary structure elements. Fitting residual was calculated using equation (12) and is plotted on the Y axis. The number of $\mathrm{C} \alpha$ atoms (one per amino acid) used in the fitting is plotted on the X axis. Residual rises with the number of $\mathrm{C} \alpha$ atoms used in the fitting because each atom contributes to the total deviation; residual increases nearly linearly with number of atoms.

Table S3. RNA and DNA rise and twist are accurately calculated compared with Curves $+{ }^{1}$ and 3 DNA ${ }^{2}$.

| Nucleic acid | Helix property | Curves $^{+1}$ | 3DNA $^{2}$ | Helios (our method) |
| :--- | :--- | :--- | :--- | :--- |
| A-DNA | rise $(\AA \AA)$ | $2.55 \pm 0.00$ | $2.54_{8}$ | $2.56 \pm 0.02$ |
|  | twist $\left({ }^{\circ}\right)$ | $32.7 \pm 0.0$ | 32.7 | $32.6 \pm 0.1$ |
| B-DNA | rise $(\AA)$ | $3.37 \pm 0.00$ | $3.37_{5}$ | $3.37 \pm 0.02$ |
|  | twist $\left({ }^{\circ}\right)$ | $36.0 \pm 0.0$ | 36.0 | $36.1 \pm 0.1$ |
| A-RNA | rise $(\AA)$ | $2.81 \pm 0.00$ | $2.81_{2}$ | $2.80 \pm 0.02$ |
|  | twist $\left({ }^{\circ}\right)$ | $32.7 \pm 0.0$ | 32.7 | $32.5 \pm 0.1$ |

All three nucleic acid structures were built using 3DNA ${ }^{2}$. For A-DNA and A-RNA, 11-bp duplexes were used. For B-DNA, a 10-bp duplex was used. One extra digit is provided for rise parameters of 3DNA because such was the precision used to generate the coordinates.

## Software

The software associated with this method is available for download as part of the supplementary material attached with this article. The filename is kHelios.tar.cf. Once the file has been downloaded and moved to a folder, untar the file (using a terminal):

```
tar -xvf kHelios.tar.cf
```

A Fortran compiler is needed to install (compile) the software. In the example that follows, it is assumed the compiler is gfortran (which is free). If an alternate fortran compiler is desired, the installation script (see below) must be modified by replacing "gfortran" appropriately).

In the terminal, move into the kHelios directory that was created in the above step:

```
cd kHelios
```

Finally, install the software using the installation script install_helios.sh:

```
./install_helios.sh
```

Follow the on-screen instructions. Test cases (sample use of the software) are provided in the kHelios/test_cases directory.
